

Course Objectives

1. Produce and mix musical projects in Ableton Live.
2. Use virtual instruments to program their own musical projects.
3. Record their works with live instruments.
4. Effectively use audio effects to enhance their musical projects.
5. Add automation techniques to their projects with effects such as reverb, delay, panning, and filtering.
6. Understand the basic mixing tools for musical projects: Equalization (EQ) and Compression.
7. Use EQ to find proper frequencies to boost or cut for each element in their project as well as use compression and sidechain compression to properly control the audio levels of their musical projects.
8. Use the concepts of EQ and compression to balance the dynamics of their projects to coincide with acceptable music industry standards.

Overarching goals:

1. Bring a musical idea to life using music production software
 - a. **Produce and export** musical projects using basic features of a digital audio workstation (DAW) such as audio/midi tracks, Midi I/O, the file explorer, piano roll, recording, and clip editing.
2. Understand and utilize the landscape of third-party Virtual Instruments and Plugins
 - a. **Identify** strengths and weaknesses of using VSTs and Plugins and finding trusted resources for obtaining them.
 - b. **Incorporate** VSTs and Plugins into projects
3. Enhance projects using audio effects and automation techniques
 - a. **Build** enhanced music projects using advanced DAW features such as reverb, delay, distortion, equalization, panning, and compression.

- b. **Evolve** audio effects with automation techniques, including how to automate effects and when to use automation to achieve a specific sound.
- 4. Mix and master music projects
 - a. **Identify** how certain audio frequencies effect a specific sound and how audio frequencies may clash with one another.
 - b. **Adjust** EQ and Volume of a project using reference material.
